

Knowledge Base & RAG Pipeline

To provide accurate and context-aware financial advice, the system uses a technical framework called Retrieval-Augmented Generation (RAG). This ensures that the AI isn't just "guessing" but is instead looking up verified information before answering.

Step 1: Storing Knowledge (FAISS)

Financial education articles and data are converted into numerical representations (embeddings) and stored in a vector database, specifically FAISS (Facebook AI Similarity Search).

Think of this as a high-speed, intelligent library index.

Step 2: Intelligent Retrieval

When you ask a specific financial question—such as "How do I calculate my 20% savings goal?"—the system doesn't rely solely on its internal memory. It instantly searches the FAISS database to retrieve the most relevant paragraphs or articles related to your query.

Step 3: AI Augmentation

The retrieved text is then passed to the AI agent as "context." The AI reads this specific data and uses it to craft a response that is grounded in facts. This significantly reduces the chance of errors and ensures the advice is consistent with established financial principles.
